Protected routes: highest presence in the highest-income quarter

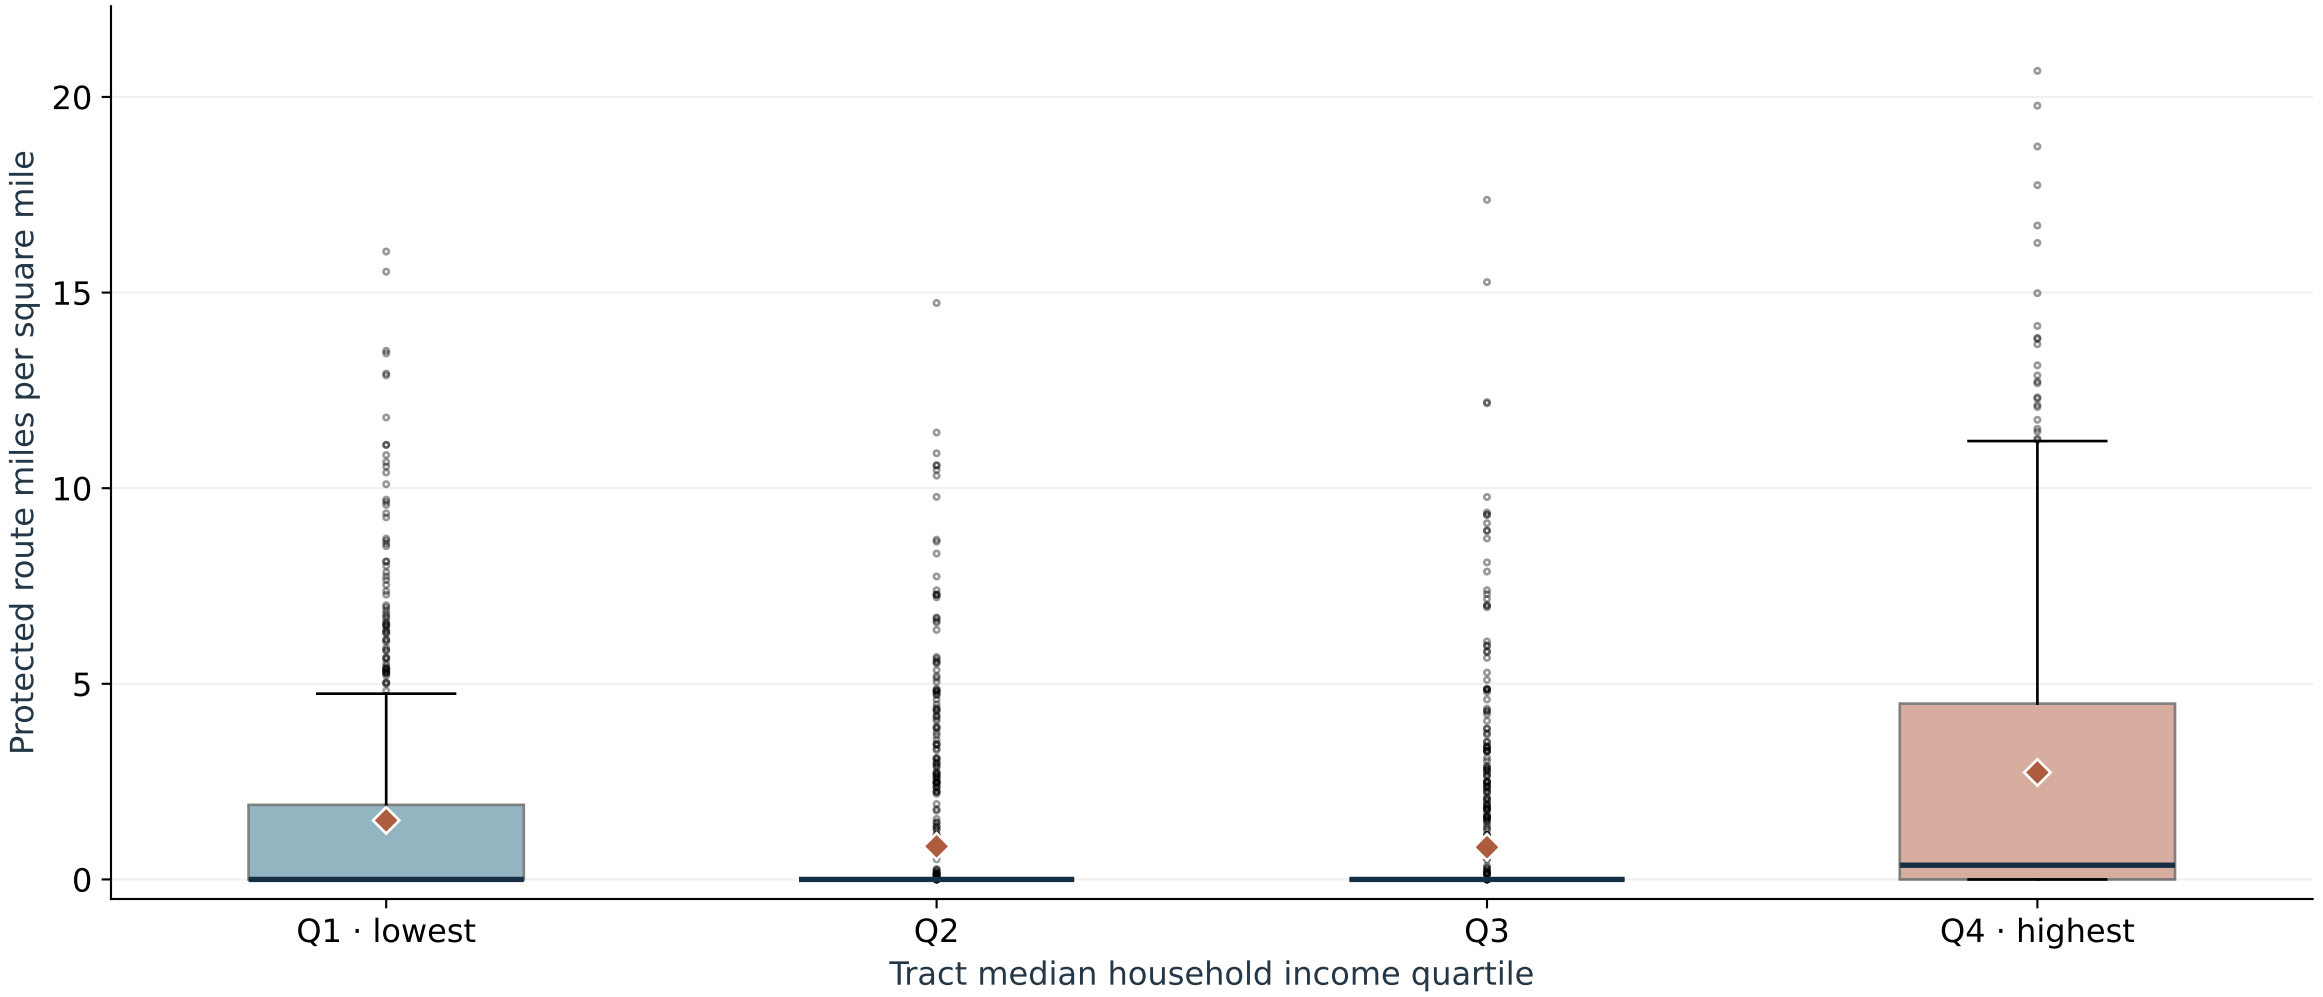

The lowest-income quarter also exceeds both middle-income quarters. Q1–Q4 each contain approximately 550 tracts.

Sources: ACS 2024 5-year income (2020–2024); supplied 2026 NYC bike routes. 2,199 tracts with usable income.
Each tract weighted equally. Routes inside tract boundaries measure infrastructure presence, not residents' usable access.

Within-group variation matters

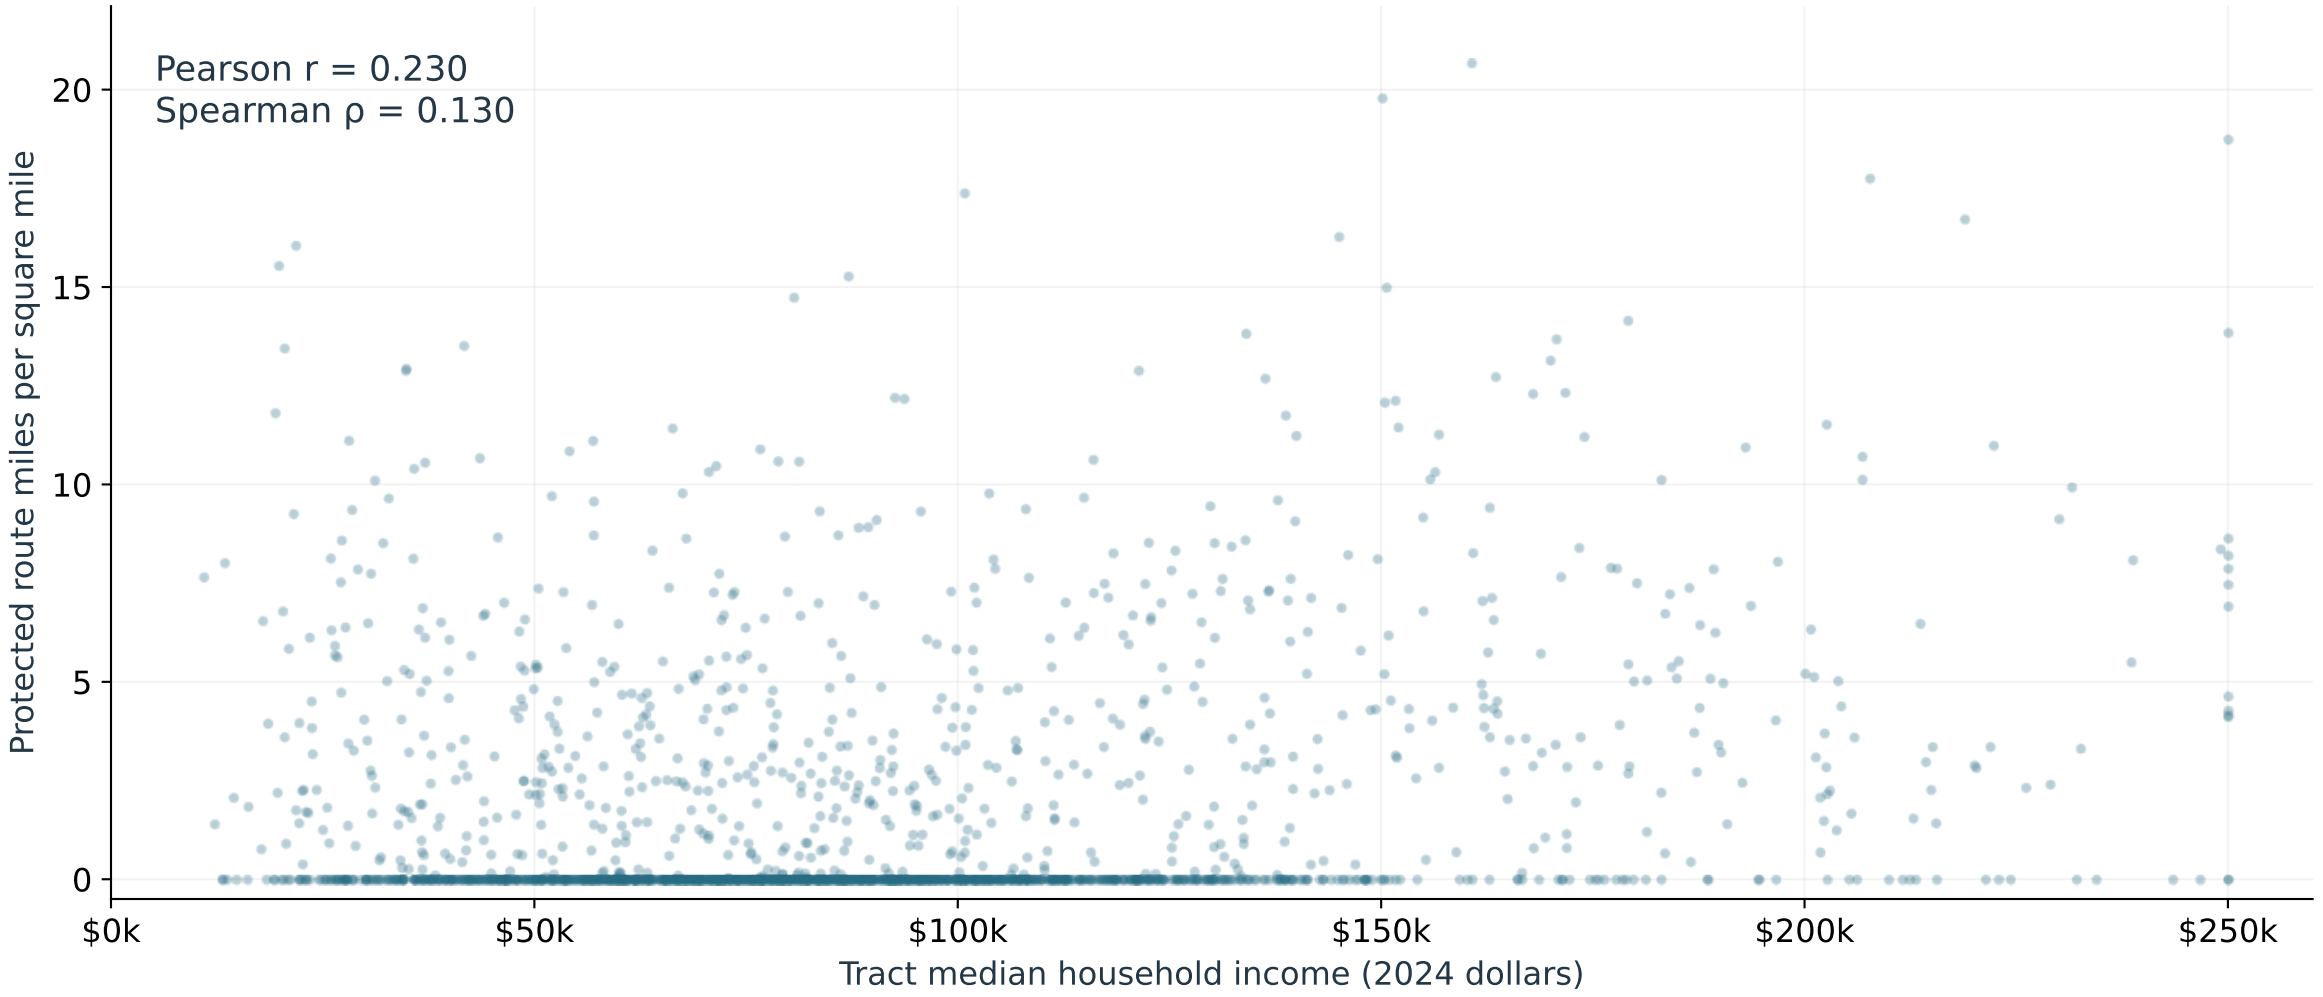

Zeros and all outliers included. Boxes: middle 50%; line: median; diamond: mean; whiskers: 1.5 × IQR.

Sources: ACS 2024 5-year income (2020–2024); supplied 2026 NYC bike routes. 2,199 tracts with usable income.
Each tract weighted equally. Routes inside tract boundaries measure infrastructure presence, not residents' usable access.

Income and protected-route density: a weak positive relationship

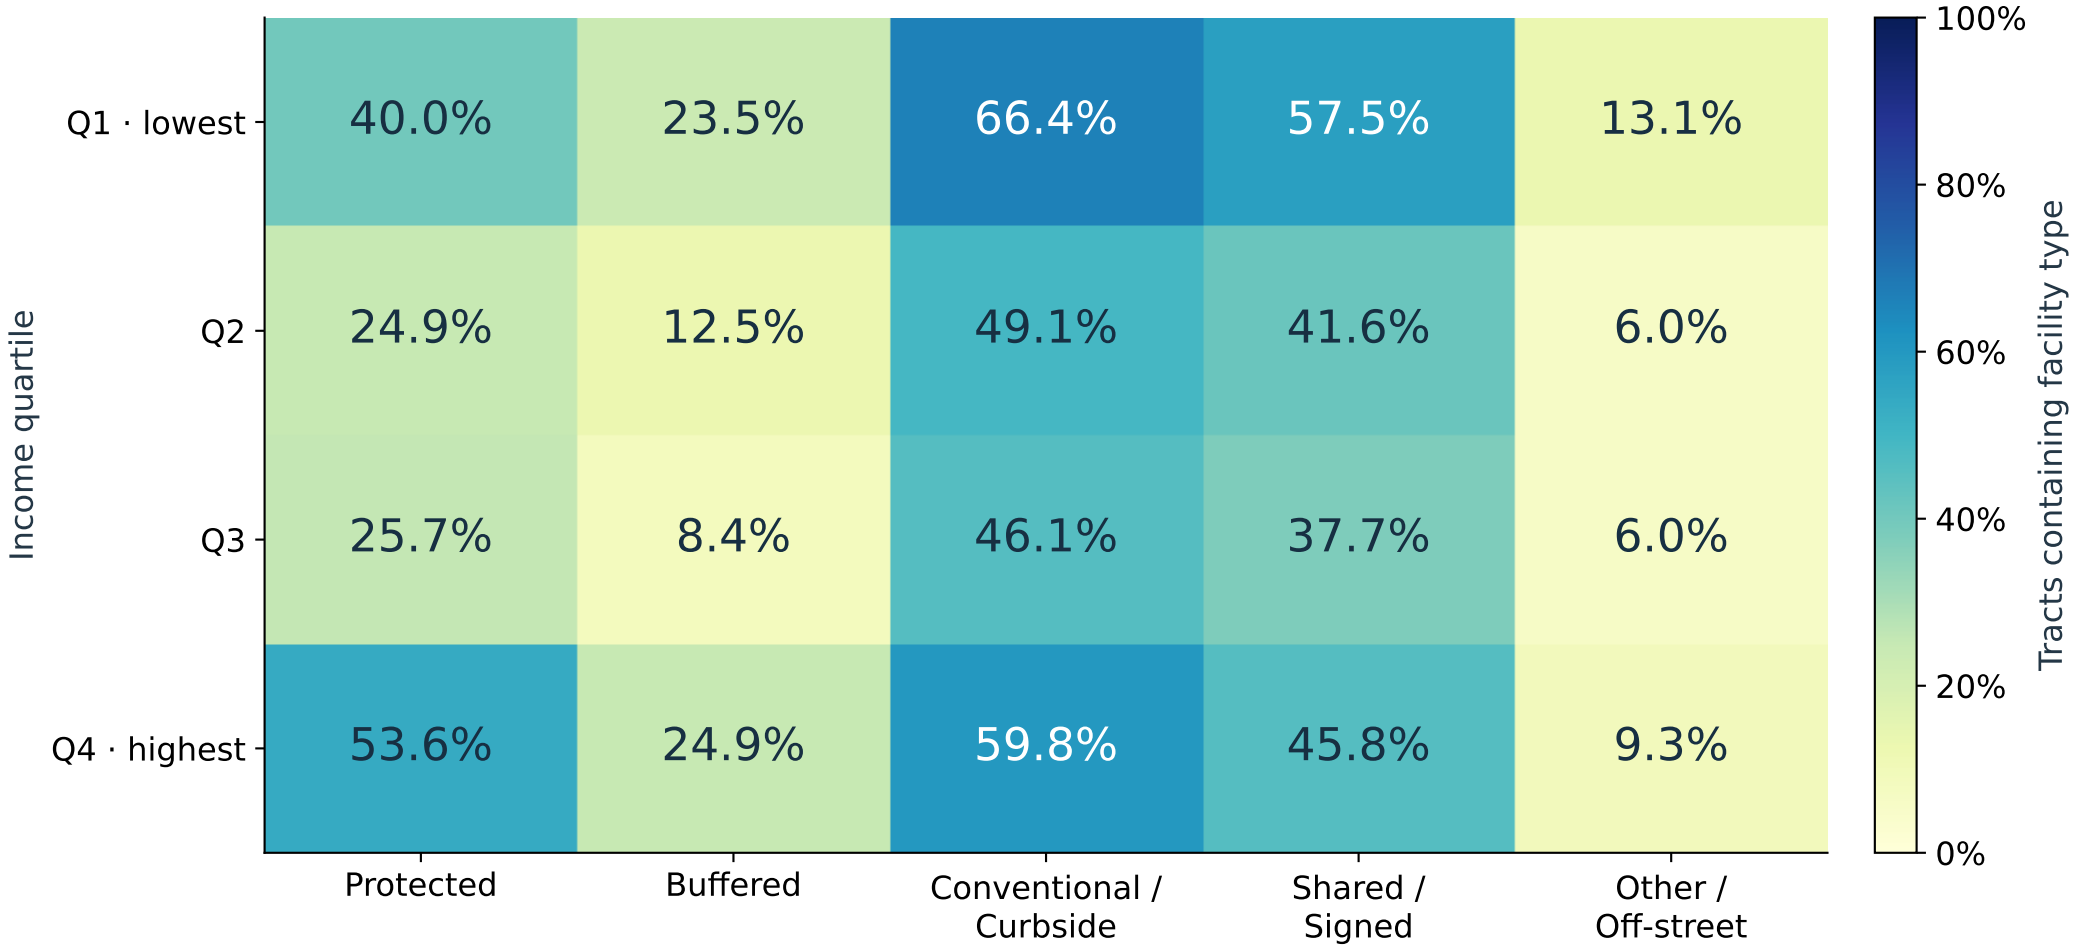

One point per census tract; overlapping points appear darker. The 13 income estimates of $250,000+ are plotted at $250,000.

Sources: ACS 2024 5-year income (2020–2024); supplied 2026 NYC bike routes. 2,199 tracts with usable income.
Each tract weighted equally. Routes inside tract boundaries measure infrastructure presence, not residents' usable access.

The infrastructure mix differs across income groups

Facility categories overlap: a tract can contain several types. Percentages do not sum to 100%; categories are not a safety ranking.

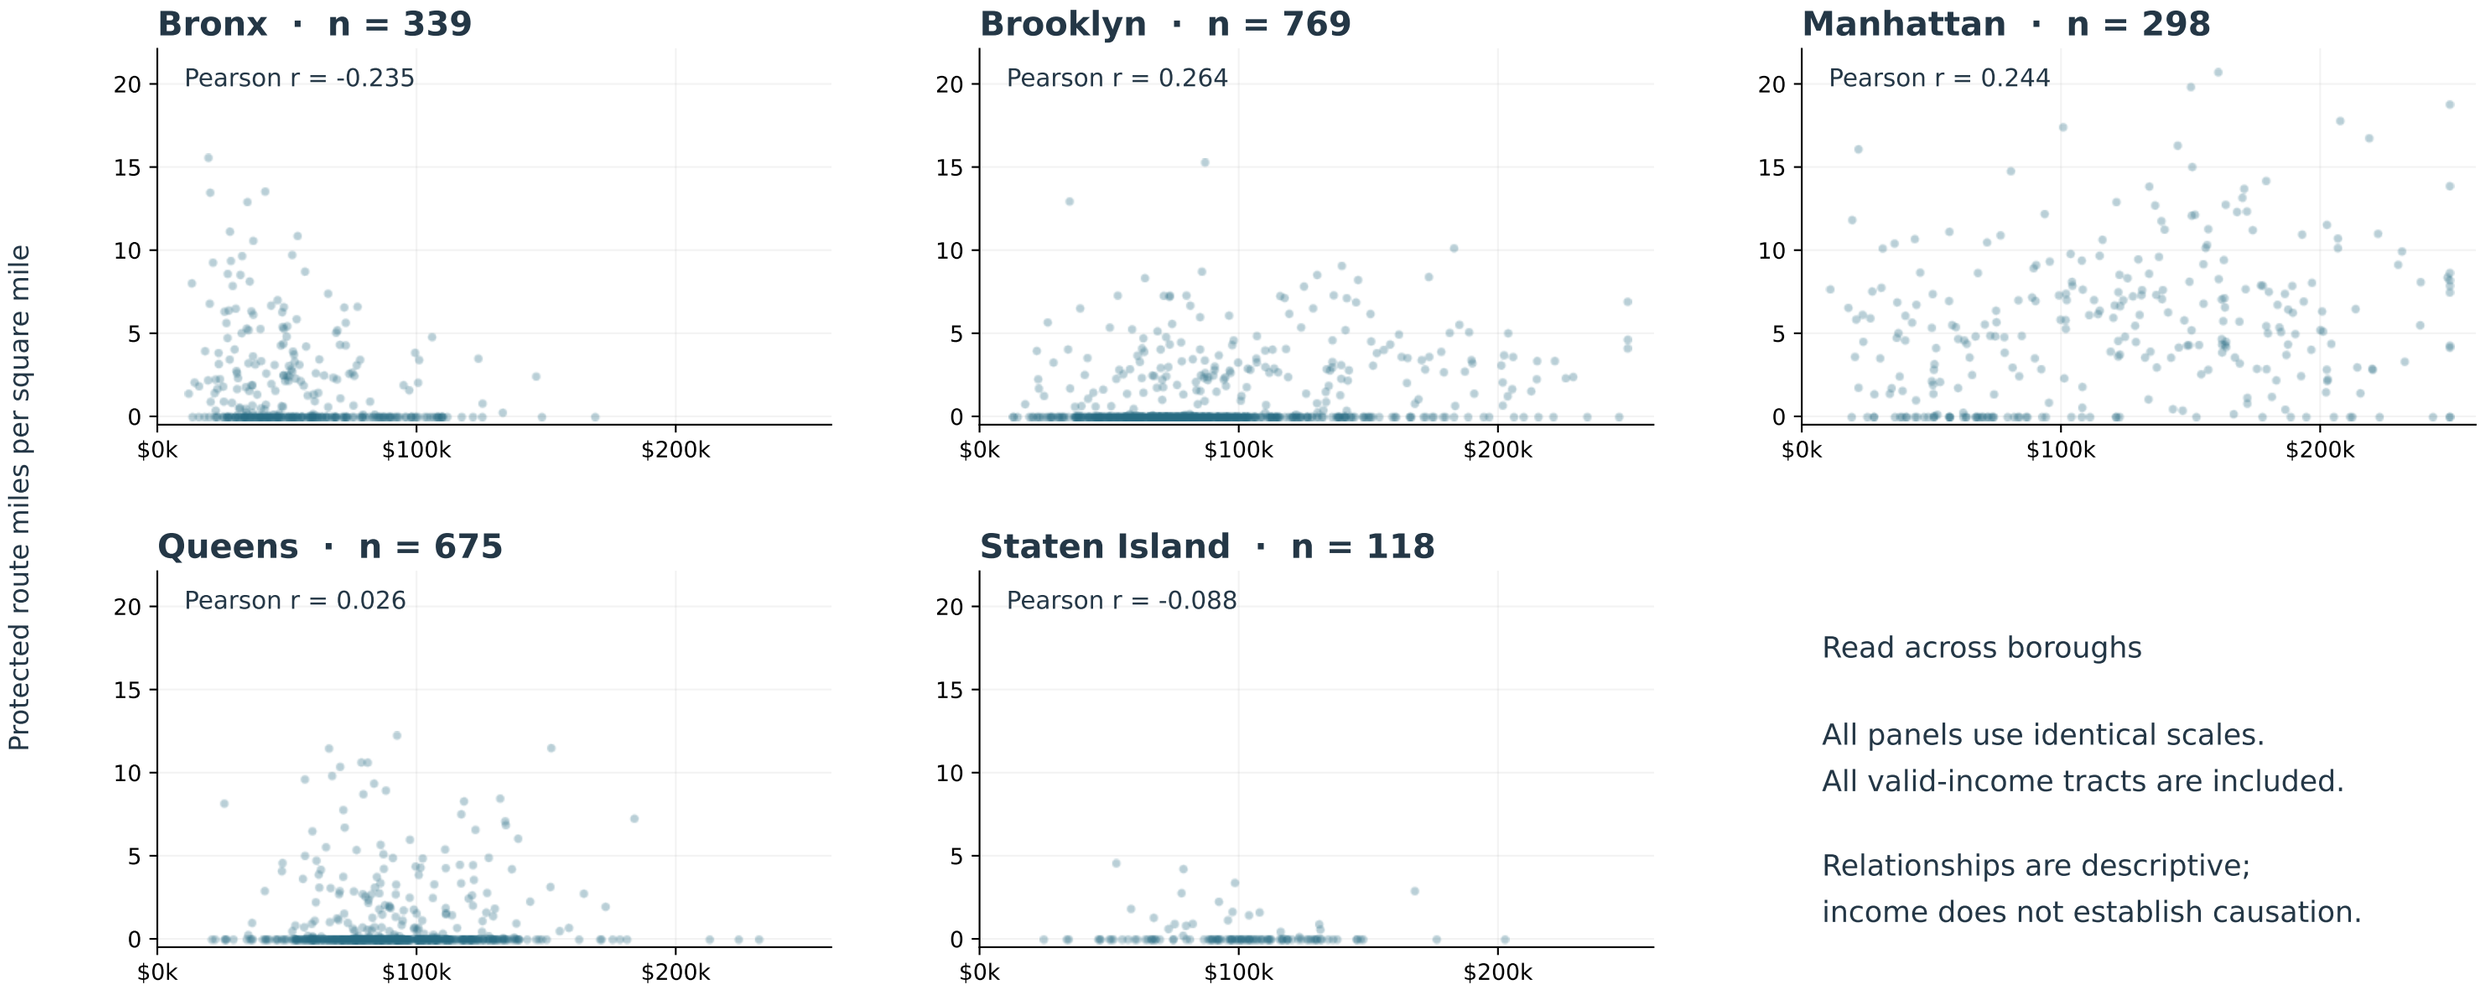

Sources: ACS 2024 5-year income (2020–2024); supplied 2026 NYC bike routes. 2,199 tracts with usable income.

Each tract weighted equally. Routes inside tract boundaries measure infrastructure presence, not residents' usable access.

The citywide relationship varies across boroughs

One point per census tract. No single income–infrastructure relationship describes all five boroughs.

Read across boroughs

All panels use identical scales.
All valid-income tracts are included.

Relationships are descriptive;
income does not establish causation.
